

App Summary

Repository-based one-page brief for the portfolio app in **D:\my portfolio\my-protfolio**.

What It Is

A personal portfolio web app for Aditya Mishra built as a React single-page application with a Netflix-inspired browsing theme. It presents skills, projects, experience, contact details, music, reading, and persona-linked mini-games.

Who It's For

Primary persona: recruiters and other visitors evaluating Aditya Mishra's background, projects, and interests.

What It Does

- Netflix-style landing flow with sound, profile selection, and personalized navigation paths.
- Role-based browsing for recruiter, developer, stalker, and adventurer personas.
- Dedicated pages for skills, projects, work experience, contact, music, and reading.
- Project gallery opens focused details from a local project catalog with images, links, and videos.
- Interactive career timeline is rendered from local timeline data with a simulated async load.
- Embedded Spotify songs and playlists plus profile-specific recommendation rows.
- Built-in mini-games mapped to personas, including chess, snake race, shooting range, and space exploration.

How It Works

- UI shell: React 18 app bootstrapped in **src/index.js**; routing is defined in **src/App.js** with React Router.
- Page layer: route targets under **src/pages** and **src/components** render portfolio sections and profile views.
- Shared pieces: **Layout**, **Navbar**, **ProfileBanner**, **TopPicksRow**, and **ContinueWatching** compose repeated UI.
- Content/data: local arrays in **ProjectsData.js**, **skillsData.js**, and **getTimeline.js**; no repo evidence of a custom backend API.
- Assets/integrations: local images, PDFs, and audio from **src/assets**; remote embeds/images come from Spotify, Giphy, and Picsum URLs in component code.
- Delivery flow: source builds into **build/**; Firebase Hosting rewrites all routes to **index.html** for SPA navigation.

How to Run

- Install Node dependencies: **npm install**
- Start locally: **npm start**
- Open: **http://localhost:3000**
- Create production build if needed: **npm run build**

Not found in repo: authentication, database, server-side services, or documented test/runbook beyond README and package scripts.
